

How pricing and billing works in RRPproxy API 2.0

As a new introduction SSL API 2.0 calculates prices of certificates using up to four different elements of each certificate. They are labeled respectively in the price list using a combination of the products API class and adding base, wildcardbase, san and/or wildcardsan. Thus, class name and billing items are separated. Only class names are used in the API commands for certificate management. Billing items appear on the price list and in accountings.

Each certificate has exactly one base price, labelled "**base**" for certificates with single domains or "**wildcardbase**" for certificates with **at least one wildcard domain**.

That means, at minimum the base price will be charged upon transactions.

Depending on the product, additional single domains are labelled "**san**", additional wildcard domains are labelled "**wildcardsan**".

The final price of a certificate is thus calculated by taking the "base" or "**wildcardbase**" price and adding any additional domains as "**san**" or "**wildcardsan**".

Background for this approach are similar methods used and provided by CAs. By incorporating these methods several products now offer additional SAN capabilities in SSL API 2.0.

Item	Explanation
Base	The basic certificate includes single domains.
Wildcardbase	The basic certificate includes at least 1 wildcard domain.
San	Additional single domain SAN.
Wildcardsan	Additional wildcard domain SAN.

In API 2.0 a certificate class is always attached to at least 1 price item and can have up to 4 in total.

Calling a class in an order command triggers pricing as described above. At least 1 single or 1 wildcard domain is always included in the -base and -wildcardbase price. Any additional single and/or wildcard domains will be summed up accordingly using prices in -san and -wildcardsan.

Exemplary orders:

- geotrustflexdv plus 3 additional single domain SANs
 - 1 * geotrustflexdv-base + 3 * geotrustflexdv-san
- geotrustflexdv plus 3 additional single domain SANs and 1 wildcard SAN
 - 1 * geotrustflexdv-wildcardbase + 3 * geotrustflexdv-san
- geotrustflexdv plus 53 additional single domain SANs and 21 wildcard SANs
 - 1 * geotrustflexdv-wildcardbase + 53 * geotrustflexdv-san + 21 * geotrustflexdv-wildcardsan

Price Mapping of SSL price names in old and new API 2.0 SSL integration

Due to the differences in legacy and new API 2.0 SSL, new classes were introduced that match old classes. Please see below for a mapping of the legacy and new classes, including the newly introduced price items.

Notes:

- The product QuickSSL Premium is renamed to GeoTrust Flex DV, following the new product naming provided by DigiCert.
- Sectigo MultiDomain DV is a new introduction, previously not available in the legacy implementation.

DigiCert

New Product name	Old API price item & class	New API 2.0 class	New API 2.0 price items	Note
GeoTrust Flex DV	quicksslpremium	geotrustflexdv	geotrustflexdv-base	Product renamed from QuickSSL Premium to GeoTrust Flex DV
			geotrustflexdv-san	
			geotrustflexdv-wildcardbase	
			geotrustflexdv-wildcardsan	
GeoTrust TrueBusiness ID EV	truebiziddev	geotrusttruebiziddev	geotrusttruebiziddev-base	
			geotrusttruebiziddev-san	
GeoTrust TrueBusiness ID OV	truebizid	geotrusttruebizidov	geotrusttruebizidov-base	
			geotrusttruebizidov-san	
	truebizidwc		geotrusttruebizidov-wildcardbase	new feature
			geotrusttruebizidov-wildcardsan	new feature
RapidSSL DV	rapidssl	rapidssldv	rapidssldv-base	
	rapidsslw		rapidssldv-wildcardbase	
SecureSite Flex EV	securesiteev	securesiteflexev	securesiteflexev-base	
			securesiteflexev-san	
SecureSite Flex OV	securesite	securesiteflexov	securesiteflexov-base	
			securesiteflexov-san	
			securesiteflexov-wildcardbase	new feature

			securesiteflexov-wildcardsan	new feature
